

Where Does the Data Come From?

Prof. Kathleen M. Carley

kathleen.carley@cs.cmu.edu

Carnegie Mellon

Center for Computational Analysis of
Social and Organizational Systems
<http://www.casos.cs.cmu.edu/>

Data Sources

- Pre-existing data sets – structured
- Questionnaires – semi-structured
 - Most tools don't have auto-features for networks
- Citation data – semi-structured
 - APIs or scrape
- Email – semi-structured
- Social Media & MMOG – semi-structured
 - APIs
 - Buy from provider
 - Constraints on data sharing and amount of data
 - Freeware – TweetTracker, BlogTracker
- Text
 - Qualitative or hand coding – e.g., invivo
 - Text mining – e.g., AutoMap, NetMapper
- Video
 - No tools

IST Institute for Software Research

Motivation

- **Fact:** Collection and storage of large volumes of text data cheap, easy, efficient
 - Book, legal documents, news, emails, web sites, blogs, chats, annual reports, political debates, mission statements, interviews
- **Need:** Techniques, measures and tools for automated knowledge discovery and reasoning about relational and sequential structures derived from linear data
- **Challenge:** Effective, efficient and controlled extraction of relevant, user-defined instances of node and edge classes from unstructured, natural language text data

Data Formats

- Unstructured
 - Raw data often in text, audio, video or mixed media form
 - E.g. news articles
- Semi-structured
 - meta-data is in near network format
 - A partial structure that can be parsed
 - E.g. email , twitter, questionnaire
- Structured
 - Already in network format
 - E.g., network data in csv format

Critical Steps

- Data Pedigree and Information Assurance
 - Tracking source and modification steps
- Storage and Retrieval
 - SVN repositories and large databases
- Data Cleaning
 - Process of removing erroneous data, creating consistent coding formats, removing typos, etc.
- Data Fusion
 - Process of merging data from multiple sources
 - Often data cleaning is done before and after
 - Requires creation of common ontology
- Data Reduction
 - Deleting un-needed data
 - Merging data into larger granules

New companies are emerging as data providers that specialize in these steps

Text Mining

- Entity Extraction
 - Who, what, where
- Entity Disambiguation
 - When do two phrases or words refer to the same entity
 - Handling pronouns, mis-spellings, etc.
- Entity Classification
 - What ontological category does a concept fall in to
- Locating Links
 - When are two “concepts” linked
 - Semantics (meaning), syntax (order), proximity
- Text Similarity
 - Are these texts the same or about the same thing
- Theme Extraction
 - What ideas and authors/texts hang together
- Sentiment Mining
 - What is the prevailing “attitude” or “belief”

Carnegie Mellon
IST Institute for Software Research

Text Analysis

- Content Analysis
 - Hot Topics
 - Themes
- Author identification
 - Pattern or “signature”
- Semantic Network Analysis
 - Mental Model
- Implied meta-network
- Activity Analysis
 - KEDS – focus on nouns
- Protocol Analysis
 - Logic reasoning
- Abstraction
 - Generate synopsis

Tools

- Lots of tools
 - Many focus on entity extraction or theme extraction
 - Many focus on only verbs or nouns
- Many tools only process part of the text
 - For news stories often the focus is only on headlines
 - For web pages often the focus is only on links or header
- Unresolved issues
 - Many
 - Time
 - Meta-data
 - Lists
 - Inferred meaning
 - Belief extraction

Carnegie Mellon
IST Institute for Software Research

Basic Approach

Focus: Meaning

- Do people use same words
- Do people use the same words in the same way

Method: Textual Analysis

- Multiple sources
- Verbal data

Result: Rich Account
Graphic or Quantified

- Shared meaning - across people
- Shifts in meaning - over time
- Topics - relations among concepts

Levels of Analysis for Concepts

- Node Level - Concept Based Techniques
 - Traditional content analysis
 - Occurrence and frequency of concepts
 - Explicit and implicit concepts
- Graph Level - Map Based Techniques, Network, Link
 - Focus on meaning and relation between concepts
 - Occurrence and frequency of concepts and statements
 - Explicit and implicit concepts and statements

Concept Circle - Example

Clustering Task # 2: April 26, 1989 Name _____

Directions: These words have been mentioned in class lectures over the past semester. Please draw a line between pairs of words which you believe should be connected. It is important that all connections that you intend to make be clear and easy to see. Please do not draw so many lines on any one worksheet that you cannot easily see how you've connected those words.

analysis approaches
 agent argument
 action aspects
 abstract attribution
 abstract author(s)
 Xbuty authority
 writing background
 weaknesses body
 tree choose the solution
 synthesis citation
 support community
 summary conclusion
 strengths contribute
 sources converge
 solution define the problem
 situation design
 shared differences
 similarities directions
 seeing the issue disclaimer
 return path elaboration
 result explore
 relevant faulty path
 reader focus
 qualification framework
 progress goal
 problem definition historical account
 problem case(s) incompatible
 problem introduction
 positions irrelevant
 plan issue
 perspective knowledge
 paradigm case(s) lens on an issue
 paper line of argument
 original novelty main path
 new milestone(s)

Concept Circle - Cont.

Variations:

When Respondent Draws Lines

- Place strength on lines
- Place arrows on lines for causality
- Place marker on lines for type of link

Application Process

- Can be applied by interviewer during interview
- Can be done as reading text

Twitter Ties

- One mode directed
 - A follows b
 - Reflection of offline social relationships
 - Apx 22.1% follow each other
 - Subscriptions
 - Bulk
 - Makes it more like a news service
 - A retweets b
 - Retweets attached to sender creating social games
 - A mentions b
 - Retweets attached to sender creating social games
- Two mode
 - Hashtag usage
- Two mode undirected
 - Co-hashtag network

Text Mining to Extract Networks

Analyst: Coding Settings

- Network Text Analysis --- Encode links between words in texts and construct network of linked words
- Content Extraction (a.k.a. Content Analysis)
- Semantic Network Extraction (a.k.a. Mental Model Analysis)
- Meta-Network Extraction (a.k.a. Structural Analysis)
- Belief Extraction (a.k.a. Context based Sentiment Analysis)
- CUES
