

Case Study: Finding Factions from Ukrainian Legislative Data

Tom Magelinski

tmagelin@andrew.cmu.edu

CarnegieMellon

Center for Computational Analysis of
Social and Organizational Systems
<http://www.casos.cs.cmu.edu/>

The Problem

- Using parliamentary voting data to analyze a government
- How do bills differ from one another?
- Which parliamentarians cooperate?
- Questions like these can be answered using networks
 - Specifically using ORA
- Ukrainian parliament has interesting structure
 - 8 official party affiliations + some MPs with no affiliation
 - Divisions not as clear as those in governments like U.S.
 - 6 potential voting options (for, against, and 4 types of abstain)

9 June 2020

Ukrainian Factions

- Ongoing research in CASOS to look at all bills to understand factions and how they change
- We'll looked at 2 bills here
 - makes things easy to interpret / visualize

CASOS

9 June 2020 Magelinski 3

Carnegie Mellon
IST Institute for Software Research

Skills Used

- Analyze bipartite network data with symbolic weights
- Clean data with ORA
- Using Link Types
 - Network Unions
- Fold networks
 - Turning bipartite networks to unipartite networks
- Visual network insights
 - Analyze networks and their attributes
 - Partial visualizations of data for better insights

CASOS

9 June 2020 Magelinski 4

Carnegie Mellon
IST Institute for Software Research

Bipartite Networks & Symbolic Links

- Bipartite: network connecting one nodeset to another, with no connections between
 - MP's (nodeset 1) are connected to Bills (nodeset 2) based on their vote
- Weights often represent strength or distance, but not always
- Symbolic weights are also useful
 - Symbolic weights can represent the type of connection (for, against a bill, for example)
- Symbolic weights must be treated differently
 - We'll show how to manipulate and compare them

CASOS

9 June 2020 Magelinski 5

Carnegie Mellon
IST Institute for Software Research

Bipartite Networks & Symbolic Links

— "For"
— "Against"

- No connections between MPs, or between Bills
 - Good only for MP-Bill Analysis (popularity)
 - Bill 1 is more popular here

CASOS

9 June 2020 Magelinski 6

Carnegie Mellon
IST Institute for Software Research

Bipartite Networks & Symbolic Links

- For symbolic weights, visualization per link type is usually most interpretable

CASOS

9 June 2020 Magelinski 7

Carnegie Mellon
IST Institute for Software Research

Unipartite Analysis (Folding)

- For conclusions within a nodeset, we need a *unipartite* graph
 - MP x MP or Bill x Bill
- This is done through folding
 - Matrix multiplication of the adjacency matrix with its transpose

$$A_{MP \times MP} = A_{MP \times Bill} * A_{MP \times Bill}^T = A_{MP \times Bill} * A_{Bill \times MP}$$

- $A_{MP \times MP}$ is the adjacency matrix for the MP to MP network, where links are *weighted* by number of bills they agreed upon

CASOS

9 June 2020 Magelinski 8

Carnegie Mellon
IST Institute for Software Research

Unipartite Analysis (Folding)

— "For"
— "Against"

Fold over bills

- Now we can compare MPs to each other

CASOS

9 June 2020 Magelinski 9

Carnegie Mellon
IST Institute for Software Research

Folding with Symbolic Weights

- Folding assumes weights are *not* symbolic
- ORA: use symbolic weights to construct separate networks
 - MP x Bill (Only votes for)
 - MP x Bill (Only votes against)
 - Etc
- Fold these separately
 - MP x MP (weights = #bills both voted "for")
 - MP x MP (weights = #bills both voted "against")
- Add them
 - MP x MP (weights = #bills with same vote of any kind)

CASOS

9 June 2020 Magelinski 10

Carnegie Mellon
IST Institute for Software Research

Look at the Data

- Open in Excel
- 'ukrainian_sample_votes.csv' :

	Source Node	Target Node	Link Type
1152	Masorina Olena Sergeevna	2540? [10]	3
2329	Masorina Olena Sergeevna	3371-1 [1]	3

- 'ukrainian_sample_MPs.csv' :

	Name	faction	gender
0	Abdullin Alexander Raftakatovich	All-Ukrainian Association (Fatherland)	male
1	Agafonova Natalia Volodymyrivna	Peter Porchenko Bloc	female

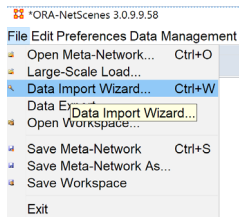

CASOS

9 June 2020 Magelinski 11

Carnegie Mellon
IST Institute for Software Research

Import Data into ORA

- Open data import wizard:

- "Import excel or text delimited files"
- "Table of network links"
- "Next" in bottom right corner

CASOS

9 June 2020 Magelinski 12

Carnegie Mellon
IST Institute for Software Research

Import Data into ORA

- Give your network a name:

Create a new meta-network with name: UKR Votes

- "Next" in bottom right corner
- Select your file path:

Step 1: Select a file containing table data with column headers:
C:\Users\magelin\Desktop\si_case_study\ukrainian_sample_votes.csv Browse

CASOS

9 June 2020 Magelinski 13

Carnegie Mellon
IST Institute for Software Research

Import Data into ORA

- Step 2
- Under SOURCE NODE:
 - Node Names
 - Nodeset Class: Agent
 - Nodeset Name: MP
- Under TARGET NODE:
 - Node Names
 - Nodeset Class: Belief
 - Nodeset Name: Bill

CASOS

9 June 2020 Magelinski 14

Carnegie Mellon
IST Institute for Software Research

Import Data into ORA

- Step 3
- Hit "New"
- Match dropdowns like below:

Step 3: Define networks and attributes based on the columns:					
Networks	Networks and Labels	Networks combined names	Attributes		
Source Node ID	Target Node ID	Link Value	Network ID	Link Type	
Source Node	Target Node	Select...	MP x Bill	Link Type	

- Hit "Next" then "Finish"

CASOS

9 June 2020 Magelinski 15

Carnegie Mellon
IST Institute for Software Research

Import Data into ORA

- Reopen Data Import Wizard
- "Table of Node Attributes"
- "Add to your existing meta-network"
 - MPs only
- Hit "browse" and find 'ukrainian_sample_MPs.csv'

CASOS

9 June 2020 Magelinski 16

Carnegie Mellon
IST Institute for Software Research

Import Data into ORA

- Match the values below:

9 June 2020 Magelinski 17

Carnegie Mellon
IST Institute for Software Research

METHOD 1: BIPARTITE ANALYSIS (AGENT-BILL NETWORK)

CASOS

9 June 2020 Change-Name 18

Carnegie Mellon
IST Institute for Software Research

Clean Data

- A look at the readme.txt shows that there are 6 voting options
- For this study, we only care about votes "for" or linkweight=3
- Goal: create 2 binary networks
 - Agent-Bill connected with "for" votes
 - Agent-Bill connected with "non-for" votes
- Method: Use network unions

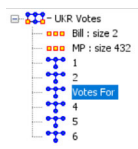

CASOS

9 June 2020 Magelinski 19

Carnegie Mellon
IST Institute for Software Research

Clean Data: Rename Votes For

- Our "3" network encodes links from "for" votes
- Simply rename this as "Votes For"

CASOS

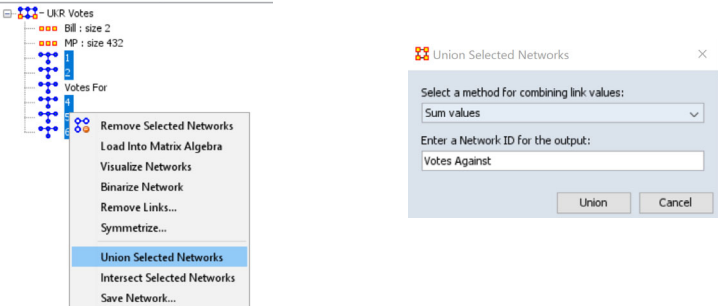

9 June 2020 Magelinski 20

Carnegie Mellon
IST Institute for Software Research

Clean Data: Votes Against

- Now, we want to combine all other networks into one
- Use a network union, summing the values

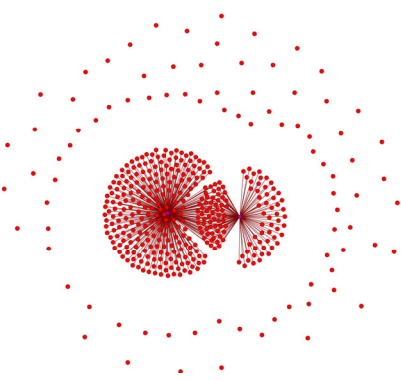

CASOS

9 June 2020 Magelinski 21

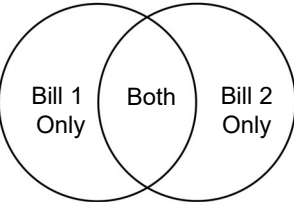

Carnegie Mellon
IST Institute for Software Research

Visualize the Agent-Bill Network

- "Visualize only this network" on the votes-for network

Think of it as a vote "for" Venn diagram:

Bill 1 Only Both Bill 2 Only

Neither

CASOS

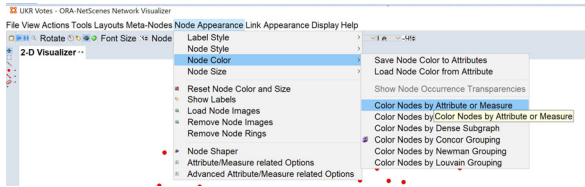

9 June 2020 Magelinski 22

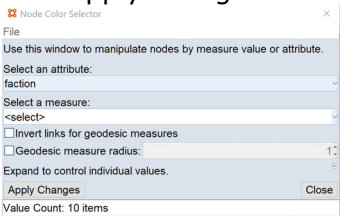

Carnegie Mellon
IST Institute for Software Research

Color by Attribute

- "Color Nodes by Attribute"

- Select "faction" and "apply changes"

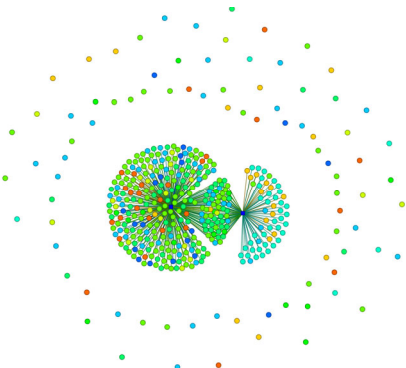

CASOS

9 June 2020 Magelinski 23

Carnegie Mellon
IST Institute for Software Research

Color by Attribute

- "Color Nodes by Attribute"

- Focus on the ratios, and what colors are *not* present

CASOS

9 June 2020 Magelinski 24

Carnegie Mellon
IST Institute for SOFTWARE RESEARCH

Conclusions About Bills

- Bill 1
 - More votes for
 - Favored by Presidential Party, Radical Party, UNION
- Bill 2
 - Less popular
 - Favored by Opposition bloc, Revival
- Overall
 - Seem like opposing bills (not much overlap, opposing parties)
 - Party bias noticeable but far from perfect

CASOS

9 June 2020 Magelinski 25

Carnegie Mellon
IST Institute for SOFTWARE RESEARCH

METHOD 2: UNIPARTITE ANALYSIS (AGENT-AGENT NETWORK)

CASOS

9 June 2020 Magelinski 26

Carnegie Mellon
IST Institute for SOFTWARE RESEARCH

Constructing the Agent-Agent Network

- MP-Bill network might not be the best
- Some aspects counter intuitive
 - "isolates" actually linked to single vote "for" MPs
- Visualization less useful with more than 3 bills
- Use MP-MP network instead
 - Link weight is the number of times two MPs agreed on a bill
 - Need to add instances of voting "for" together and voting "against" together
- Better to answer questions about MPs instead of questions about bills

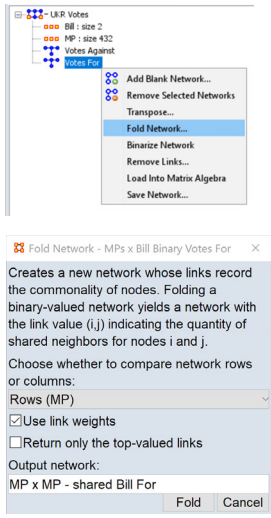

CASOS

9 June 2020 Magelinski 27

Carnegie Mellon
IST Institute for SOFTWARE RESEARCH

Constructing the Agent-Agent Network

- Fold vote "for" network:
- Rename output and press "fold"
- Repeat with "against" network

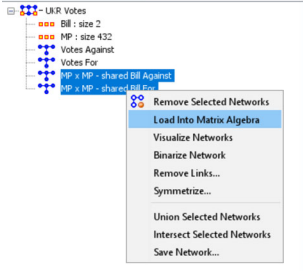

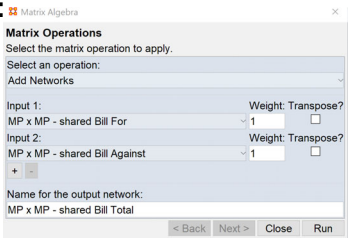

CASOS

9 June 2020 Magelinski 28

Carnegie Mellon
IST Institute for SOFTWARE RESEARCH

Constructing the Agent-Agent Network

- Load networks into matrix algebra:
- Add Networks:

CASOS

9 June 2020 Magelinski 29

Carnegie Mellon
IST Institute for SOFTWARE RESEARCH

Visualize the Agent-Agent Network

- “Visualize only this network”
- “Load normally”
- Agents can agree between 0 and 2 times
 - Want to only see strongest ties (weight = 2)

Remove links with weight less than or equal to

- Make sure the box is checked!!

CASOS

9 June 2020 Magelinski 30

Carnegie Mellon
IST Institute for Software Research

Visualize the Agent-Agent Network

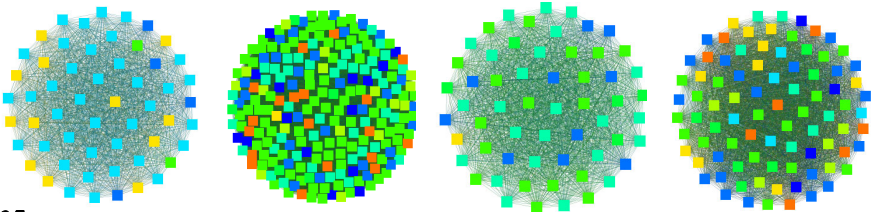

- Increase node size and decrease link weight using arrows

UKR Votes - ORA-NetScenes Network Visualizer

File View Actions Tools Layouts Meta-Nodes Node Appearance Link Appearance Displ:

Rotate Font Size Node Size Link Width

- Color by faction:

CASOS

9 June 2020 Magelinski 31

Carnegie Mellon
IST Institute for Software Research

Conclusions about MPs

- MPs affiliated with the opposition block vote together, and rarely with others
- MPs not affiliated with a faction are spread over all the groups
- Presidential party members mostly in one group, but there are members in all the other groups
- **Grouping not fully defined by parties**
 - More interesting results from more data

CASOS

9 June 2020 Magelinski 32

Carnegie Mellon
IST Institute for Software Research

Overall Conclusions

- Matrix algebra / link operations are extremely useful
 - Especially for symbolic links
 - Separate a network into multiple networks (for/against)
- Must be careful visualizing bipartite data
 - Especially with symbolic weighting
- Folding a network can be used to answer different research questions
- Network visualization is quick and powerful
 - Especially for network attributes

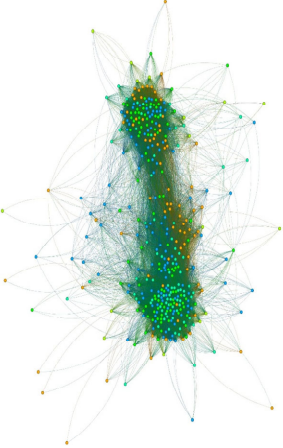

CASOS

9 June 2020 Magelinski 33

Carnegie Mellon
IST Institute for Software Research

Research on Factions

- When all available bills are studied, networks get more complex
- Not all bills are equal, so we have developed weighting strategies to get the most meaningful connections
- Community detection algorithms are used to find “factions”

CASOS

9 June 2020 Magelinski 34

Carnegie Mellon
ISI Institute for SOFTWARE RESEARCH

Research on Factions

- Faction dynamics are used to find change points
- Look at “snapshots” of a network and compare similarity
- Change-point seen here is the revolution
